| 3.0 | 0.49865 | 0.4987 | 0.4987 | 0.4988 | 0.4988 | 0.4988 | 0.4989 | 0.4989 | 0.4989 | 0.4990 |

Example 1

Using the probability values in Table 4.3, show that the probability that a measurement will yield a value within $x' \pm \sigma$ is 0.6826 or 68.26%.

Example 2

Now consider the measurements from the ball bearing factory in topic 1.

Example 2

If the true mean is 0.5 inches, what is the probability that a individual bearing will measure within 0.45σ of the mean ? What about 0.15σ ?

Example 2

What is the probability that a individual bearing will measure between 0.44 and 0.49 inches?

Example 2

If the true mean is 0.5 inches, estimate the uncertainty interval at a probability of 70%. Also estimate the uncertainty interval at a probability of 90%. What is the probability that a individual bearing will measure within 0.45σ of the mean ? What about 0.15σ ?

Example 3

What is the probability that a individual bearing will measure between 0.40 and 0.44 inches? What is different about this problem? What is the significance of the z value not present in the table?
