Topic 1 - Histograms and Probability Density Functions

- A Population of Data

- Randomly Distributed Data

- Frequency Histogram

- Probability Density Function

A Population of Data

Consider a manufacturer that makes 100000 of ball bearings in a set.
- How does the manufacturer ensure the quality of the product?
- How the does the seller communicate this to the buyer?
- How does the engineer use this information?

Images: Wikipedia

A Population of Data

The data set, or population, is generated by taking measurements of individuals chosen randomly from the entire population. **Sampling** refers to repeated measurements of the **measured variable** under fixed operating condition.

$$X = \{x_1, x_2, x_3, ..., x_i, ..., x_{n-1}, x_n\}$$

Randomly Distributed Data

Our discussion will assume that the values in the data set are
randomly distributed about a mean value. It is important to
consider what this means.

Frequency Histogram

"A histogram is an accurate representation of the distribution of numer- ical data. It is an estimate of the probability distribution of a continuous variable (CORAL) and was first introduced by Karl Pearson.[1] It differs from a bar graph, in the sense that a bar graph relates two variables, but a histogram relates only one." - Wikipedia

Frequency Histogram

Consider sampling the 0.5 inch diameter ball bearings.

Data: Generated in MATLAB, see probabilty_statistics_topic1.m

Frequency Histogram

Draw Historgram by hand

Frequency Histogram

Probability Density Function

Activity: Complete as an individual, discussion with peers is encouraged.
Write a MATLAB progam to do the following:

1. Generate a population of data that is randomly distributed about a central mean to represent a repeated measurement or physical property. One suggestion is to use the built-in function *normrnd()*. Choose the population size, mean value, and standard deviation.

2. Show the data in a labeled figure with item number on the x-axis and measured value on the y-axis.

3. Create a histogram using the population of data. One option is to use the MATLAB function *histogram()*. Choose an appropriate bin size for the histogram to represent the data. The goal is to show the central tendancy and random distribution of the population of data.

4. Show a continuous probability density function to represent the data. The function should have the same mean value and standard deviation as used above.

Deliverables: Upload your MATLAB code to the appropriate folder as a .m file
Concept Example: Sketch Histograms and Probabilty Density Functions. Include your name, date, and topic in the program file.

Probability Density Function

Topic 2 - Characterizing a Population of Data

- A Population of Data

- Variance and Standard Deviation

- Using the Z Table

- Example: Using the Z Table

A Population of Data

Consider a manufacturing facility that makes ball bearings.

- How does the manufacturer ensure the quality of the product?
- How the does the seller communicate this to the buyer?
- How does the Engineer use this information?

A Population of Data

For a given set of measurements we want to quantify:

- a representative value that characterizes the average of the measured data set

- a representative value that provides a measure of the variation in the data set

- how well the average of the measured data set represents the average of the entire population

# Variance and Standard Deviation

The true variance is:
$$\sigma^2 = \int\limits_{-\infty}^{\infty} (x - x')^2 p(x) dx$$
For discrete data this becomes:

$$\sigma^2 = \lim_{N \to \infty} \frac{1}{N} \sum_{i=1}^{N} (x_i - x')^2$$

The square root of the variance is the standard deviation.

$$\sigma = \sqrt{\sigma^2}$$

Using the Z Table

... The area under the portion of the probability density function curve, $p(x)$, defined by the interval $x' - z_1\sigma \leq x \leq x' + z_1\sigma$ provides the probability that a measurement will assume a value within that interval. Direct integration of $p(x)$ for a normal distribution between the limits $x' \pm z_1\sigma$ yields that for $z_1 = 1, 68.26\%$ of the area under $p(x)$ lies within $\pm 1\sigma$ x' . This means that there is a 68.26% chance that a measurement of x will have a value within the interval $x' \pm 1\sigma$.

Using the Z Table
$z_1 = 1, 68.26\%$ of the area under $p(x)$ lies within $\pm z_1 \sigma$ of x'.

$z_1 = 2, 95.45\%$ of the area under $p(x)$ lies within $\pm z_1 \sigma$ of x'.

$z_1 = 3, 99.73\%$ of the area under $p(x)$ lies within $\pm z_1 \sigma$ of x'.

Using the Z Table

It follows directly that the representative value that characterizes a measure of the variation in a measured data set is the standard deviation. The probability that the ith measured value of x will have a value between $x' \pm z_1 \delta$ is $2 \times P(z_1) \times 100 = P\%$. This is written as
$$x_i = x' \pm z_1 \sigma \quad (P\%)$$

Using the Z Table

Example: Using the Z Table

Table 4.3 Probability Values for Normal Error Function: One-Sided Integral Solutions for $p(z_1) = \frac{1}{(2\pi)^{1/2}} \int_0^{z_1} e^{-\beta^2/2} d\beta$
